

THE PATHWAY TO A MORE PROTECTED BUILDING

Modernize your building connectivity with the Connected Life Safety Services (CLSS) Pathway

Plain Old Telephone Service (POTS) lines are outdated, unreliable, and costly. With POTS lines, there is no guarantee that your fire alarm signal will make it to the monitoring center – a risk you shouldn't have to take.

Find out how we can save you money while providing a safer, more connected service with the CLSS Pathway communicator.

STOP PAYING MORE FOR LESS

Most phone companies are charging \$150-\$300* per month (with rates increasing) for 2 monitored POTS lines. Alarm communication over POTS lines is also one of the top sources of nuisance alarms – stop paying for those, too. By switching to cellular/IP service, you could be paying up to 50% less per month. (*average rates)

INCREASED AWARENESS AND COMPLIANCE

We can give you access to the CLSS Facility Manager app which provides insight into scheduled system testing, digital inspection reports, device inventory, and more. See what's happening across your sites on one single platform.

There's a better way to connect your building
– the CLSS Pathway is available now.

A MORE RELIABLE CONNECTION

POTS lines are difficult to maintain and prone to outages, especially in inclement weather. The CLSS Pathway establishes a more reliable connection from your buildings to the monitoring center with dual-sim support and dual path communication. CLSS also supports a faster emergency response time by sharing contextual alarm information to first responder apps.
